CIT 140 · Week 7 · Data-Quality Report

Meridian Forge · fictional inspection export v1

Learner name / date	Andy Castillo 10/28/2026
Import status	Load all 20 rows first

Amber cells: your responses. Other results calculate from Prepared and Audit.

Rule	Check	Rows flagged	Share of all rows	**Affected Row_IDs**
Q01	Machine ID is required	2	10%	R03, R14
Q02	Work order is unique	2	10%	R05, R06
Q03	Status uses the agreed list	2	10%	R08, R16
Q04	Duration is in range	3	15%	R10, R18, R20
Q05	READY identifies an inspector	3	15%	R03, R07, R12
Distinct rows with any issue		11	55%	Count each row once, even when several Q-rules flag it. Do not add the five counts.

Scope: all 20 supplied records. Q02 flags every row in a repeated Work_Order_ID group; extra duplicate copies are a different measure. Unresolved fields remain flagged, not guessed.

Source: authored CIT140 case W07-S01 (Raw) and W07-S02 (rules). Report a data-quality finding, not a machine safety clearance. Explain your evidence and next action on page 2.

Week 7 · Explanation and refresh evidence

Finding: Row_ID, Q-number, actual value, source and effect

R03 and R14 are missing Machine_IDs. R05 and R06 have the same work order number and R08 also has a spelling mistake in its status being RDEAY. These problems can make the records confusing because there are mistakes and missing data.

Next action: what to verify, who owns it, and how to retest

Since the staff own it they should check the original records to find the correct information. Once they fix it I would simply refresh the data to see if the errors are still there or if any other problems happen.

Limit: why you cannot guess a correction or prove accuracy

No one should ever be guessing data that isnt 100% confirmed with the records which is why they should always be checked and used. Just because someone may think something is correct that can turn to human error.

Professional connection: one framework idea and how you used it

A framework idea would be data quality because it's purpose is to make sure information is correct and complete. A simple check I used was checking for incorrect values.

Refresh test: before, changed value, after, and restored result

Before I refreshed it showed 3 errors in Q04 and a total of 11 errors, I then changed the inspection time value from R01 to 0 which made Q04 show 4 errors and a total of 12 errors. I then changed it back to 20 and Q04 and the total errors went back to its previous value. This means when I change a value my report will update itself.

Export only Report: two landscape pages, page break before row 26. Review both pages.
